In general, the reaction between the compound of Formula (XI) and the compound of R<sub>8</sub>—W can be carried out in the presence of an acid acceptor. Exemplary acid acceptors which can be employed include the same ones as employed in the reaction between the compound of Formula (II) and the compound of Formula (III).

This reaction is, in general, carried out in the presence of a reaction medium. Exemplary reaction media which can be employed include the same one as employed in the reaction between the compound of Formula (III) and the compounds of Formula (III).

The amount of the compound of R<sub>s</sub>—W which can be employed is at least 1 mol and typically ranges from 1 mol to about 20 mols, preferably from 1.2 mol to 10 mols per mol of the compound of Formula (XI).

The amount of the acid acceptor employed is preferably about 1 to about 10 equivalents and more preferably 1 to 4 equivalents for each mol of the compound of Formula (III) and (XI) respectively.

The reaction between the compound of Formula (XI) and the compound of R<sub>8</sub>—W can be carried out typically at a temperature of from about -30°C to about 200°C and preferably from about 0°C to about 100°C.

While this reaction may be carried out at a pressure above atmospheric or under reduced pressure, it is advisable to employ atmospheric pressure for practical purposes.

The method of separating and purifying the isoquinolinesulfonyl derivative of Formula (I) from the reaction solution comprises extracting the compound of Formula (I) with diluted hydrochloric acid, rendering the aqueous hydrochloric acid layer extracted basic, extracting the extract with a solvent such as chloroform capable of easily dissolving the extract, condensing the extract and subjecting the condensed residues to a silica gel column or an aluminum column chromatography for purification.

It has now been found that the isoquinolinesulfonyl derivatives of Formula (I) and the pharmaceutically acceptable salts have pharmacol gically and biochemically interesting properties such as a relaxatory action for vascular smooth muscle and an action for increasing blood flow and are useful as a vasodilator, a hypotensor, an ameliorant of cerebral circulation, a medicine for angina pectoris and a preventive and a medicine for cardiovascular thrombosis.

The effect of the isoquinolinesulfonyl derivatives and the pharmaceutically acceptable acid addition salts of this invention on smooth muscle can be proved by suspending a mesenteric artery taken out from a rabbit in a helical form, contracting the mesenteric artery with potassium chloride and adding the isoquinolinesulfonyl derivatives or their pharmaceutically acceptable acid addition salts of this invention to the contracted mesenteric artery, resulting in the relaxation of the mesenteric artery. When, for example, 1-(5-isoquinolinesulfonyl)-4-methylpiperazine, i.e., Compound (36) was added and a complete relaxation was designated 100%, the concentration which could bring about a relaxation of 50%, i.e., ED<sub>50</sub> was 7.7  $\mu$ M, 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound (35) and N-(4-aminobutyl)-5-isoquinoline sulfonamide, i.e., Compound (3), ED<sub>50</sub> were 0.6  $\mu$ M and 11  $\mu$ M, respectively.

The effect of the isoquinolinesulfonyl derivatives and the pharmaceutically acceptable acid addition salts of this invention on the vasodilatation of the femoral and vertebral arteries can be measured by anesthetizing a dog of mixed breed weighing 8 to 15 Kg by an intravenous administration of 35 mg/Kg of pentbarbital, providing an acute type probe (a product of Nippon Koden K.K., Japan) with the femoral and vertebral arteries, administering the isoquinolinesulfonyl derivatives and the pharmaceutically acceptable acid addition salts to the femoral vein through a polyethylene tube inserted into the femoral vein side chain and measuring the blood flow volume with an electromagnetic flowmeter (a product of Nippon Koden K.K., Japan, "MF—27"). Among the isoquinolinesulfonyl compounds of Formula (I) of this invention, those with I=0 and the

$$R_{2}$$
group = the  $-N$

 $R_{3}$ 

group show a high action for increasing blood flow and simultaneously a selectivity to vertebral arteries. For example, when 1 mg/Kg of 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound (35) was intravenously administered, the increased blood flow volumes in the vertebral artery and in the femoral artery were 98% and 65%, respectively. Also the isoquinolinesulfonyl compounds of Formula (I) of this invention with I=1 and one of the  $R_2$  and  $R_3$  groups I=1 and I=1 and I=1 and I=1 and I=1 artery was continued flow volume in the vertebral artery was continued for at least 30 minutes.

in the blood flow volume in the vertebral artery was continued for at least 30 minutes.

Furthermore, when the isoquinolinesulfonyl derivatives and the pharmaceutically acceptable acid addition salts of this invention are intravenously and arterially administered for the above described purposes, any remarkable toxicity cannot be observed. For example, the acute toxicity of 1-(5-isoquinolinesulfonyl)-4-methylpiperazine, i.e., Compound (36), i.e., LD<sub>50</sub> was 94 mg/Kg in giving male ddY-strain mice an intravenous administration.

The following examples illustrate the present invention in more detail.

### Example 1

In 200 ml of chloroform was dissolved 8.8 g of 1,4-diaminobutane, and to the solution was added dropwise 100 ml of a chloroform solution containing 4.55 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the chloroform solution, the mixed solution was stirred at a temperature of 20°C to 25°C for two hours, and then the reaction solution was extracted with a 10% aqueous hydrochloric acid solution. The pH of the aqueous layer was adjusted to 10 with a 10% aqueous sodium hydroxide solution, and the aqueous layer was extracted with chloroform. The chloroform layer extracted was washed with water and dried with anhydrous potassium carbonate. Then the chloroform was distilled from the chloroform layer, and the residue obtained was subjected to a column chromatography [silica gel: 200 g; developing solvent: 2% methanol/chloroform (volume ratio)] to give 3.46 g of N-(4-aminobutyl)-5-isoquinolinesulfonamide, i.e.; Compound (3) as an oily substance in a yield of 62%.

The results and the analytical values of these compounds are shown in Table 1—2.

Exampl 2

In 50 ml of dichloromethane was dissolved 1.73 g of 5-isoquinolinesulfonyl chloride, and to the solution were added 1.54 g of triethylamine and 8.0 g of monomethylamine hydrochloride. The mixture was stirred at a temperature of 10°C to 15°C for 18 hours. The reaction solution obtained was washed with water, dried with magnesium sulfate, and then the dichloromethane was distilled therefrom under reduced pressure. The residue obtained was subjected to a silica gel column chromatography (silica: 50 g; solvent: chloroform) to give 1.30 g of N-methyl-5-isoquinolinesulfonamide, i.e., Compound (25) in a yield of 77%.

In 100 ml of methylene chloride were added 6.0 g of piperazine and 1.2 g of anhydrous potassium carbonate, and to the mixture was added dropwise 30 ml of a methylene chloride solution containing 2.0 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the methylene chloride solution, the mixed solution was stirred at a temperature of 15°C to 25°C for 15 hours, and then the reaction solution was washed with water, dried with anhydrous magnesium sulfate, and the methylene chloride was distilled therefrom. The residue thus obtained was subjected to a silica gel column chromatography (silica gel: 70 g; solvent: chloroform) to give 2.14 g of 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound (35) in a yield of 89%.

### Example 5

In 50 ml of a chloroform solution containing 1.4 g of 3-dimethylaminopropylamine and 1.4 g of triethylamine was added dropwise 30 ml of a chloroform solution containing 2.6 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the chloroform solution, the mixed solution was stirred at a temperature of 2°C to 10°C for four hours, and the reaction mixture solution was washed with water and dried with anhydrous magnesium sulfate. After the chloroform was distilled therefrom, the residue obtained was subjected to a silica gel column chromatography (silica gel: 70 g; solvent: chloroform) to give 2.38 g of N-(3-dimethylaminopropyl)-5-isoquinolinesulfonamide, i.e., Compound (17) in a yield of 71%.

Mass spectrum (m/e): 293, 249, 235, 221 and 207

NMR spectrum (CDCI<sub>3</sub>): 1.6 (2H,  $CH_2$ ), 2.0—2.6 (8H,  $2 \times NCH_3 + NCH_2$ ), 3.1 (2H,  $NCH_2$ ), 6.2 (NH), -7.7 (1H), 8.0—8.6 (4H) and 9.3 (1H)

The same procedures as described above were repeated using the compounds of Formula (III) as set forth in Table 4-1 under the reaction conditions as set forth in Table 4-1, and there were obtained N-(3-diethylaminopropyl)-5-isoquinolinesulfonamide, i.e., Compound (18); N-(3-di-n-butylaminopropyl)-5-isoquinolinesulfonamide, i.e., Compound (19); N-(3-piperidinopropyl)-5-isoquinolinesulfonamide, i.e., Compound (20); N-(3-morpholinopropyl)-5-isoquinolinesulfonamide, i.e., Compound (21); N-[3-(N-methyl-N-cyclohexylamino)propyl]-5-isoquinolinesulfonamide, i.e., Compound (22); N-[3-methyl-N-phenylamine)propyl]-5-isoquinolinesulfonamide, i.e., Compound (23); and N-[3-(N-methyl-N-benzylamino)propyl]-5-isoquinolinesulfonamide, i.e., Compound (24). The results and the analytical values of these compounds are shown in Table 4-2.

### Example 6

In 100 ml of chloroform was dissolved 5.0 g of 1-methylpiperazine, and to the solution was added 6.9 g of anhydrous potassium carbonate. To the mixture was added dropwise 200 ml of a chloroform solution containing 1.4 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the chloroform solution, the mixed solution thus obtained was stirred for one hour under cooling with ice, and then the reaction solution was washed with 50 ml of a 5N aqueous sodlum hydroxide solution and extracted twice with 50 ml of a 5N aqueous hydrochloric acid solution. The aqueous hydrochloric acid layer was rendered alkaline, extracted three times with 100 ml of chloroform, and the chloroform layer extracted was washed with water and dried with anhydrous 10 magnesium sulfate. After the chloroform was distilled therefrom under reduced pressure, 50 ml of a 5N aqueous hydrochloric acid solution was added to the residue and the mixture was condensed to dryness under reduced pressure. The crystalline residue thus obtained was recrystallized from ethanol to give 14.9 g of 1-(5-isoquinolinesulfonyl)-4-methylpiperazine [i.e., Compound (36)] dihydrochloride in a yield of 82%.

#### Example 7

In 100 ml of ethanol were added 2.77 g of 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound (35), 1.66 g of anhydrous potassium carbonate and 5.45 g of ethyl bromide, and the reaction was carried out at an external temperature of 70°C for 24 hours. After the reaction solution was filtered, the 25 filtrate was condensed and the residue was dissolved in 50 ml of chloroform, and the solution was extracted twice with a 2N aqueous hydrochloric acid solution. The aqueous hydrochloric acid layer was rendered alkaline, extracted twice with 50 ml of chloroform, and the chloroform layer extracted was washed with water and dried with anhydrous magnesium sulfate. After the chloroform was distilled therefrom, the residue obtained was subjected to a silica gel column chromatography (silica gel: 100 g; solvent: 2% methanol-chloroform) to give 2.26 g of 1-(5-isoquinolinesulfonyl)-4-ethylpiperazine, i.e., Compound (42) in a yield of 74%.

Melting point (the dihydrochloride recrystallized from ethanol): 221°C

Mass spectrum (m/e): 305 (M+), 290 (M-15), 277, 128 and 113

### Example 9

In 30 ml of chloroform was added 1.42 g of 1-isobutylpiperazine and 2.76 g of potassium carbonate, and to the mixture was added dropwise 50 ml of a chloroform solution containing 2.28 g of 5-isoquinolinesulfonyl chloride under cooling with ice. The aqueous hydrochloric acid layer was rendered alkaline, extracted three time with 30 ml of chloroform, and the chloroform layer extracted was washed with water and dried with anhydrous magnesium sulfate. After the chloroform was distilled therefrom under reduced pressure, the residue obtained was subjected to a silica gel column chromatography (silica gel: 100 g; solvent: 2% methanol-chloroform) to give 2.60 g of 1-(5-isoquinolinesulfonyl)-4-isobutylpiperazine, i.e., Compound (47) in a yield of 78%

Melting point (the dihydrochloride recrystallized from ethanol): 234°C

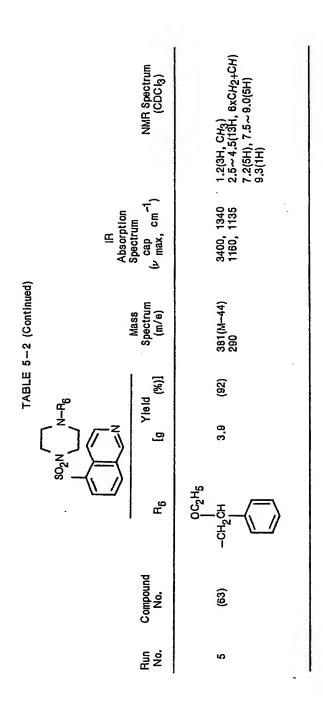

Mass spectrum (m/e): 333 (M<sup>+</sup>), 290 (M-C<sub>3</sub>H<sub>7</sub>), 141 and 128 NMR spectrum (CDCl<sub>3</sub>,  $\delta$ ): 0.8 (6H, d, 2×CH<sub>3</sub>), 1.2—2.0 (1H, m, CH), 2.0—3.3 (10H, 5×NCH<sub>2</sub>), -8.8 (5H) and 9.3 (1H, s)

The results and the analytical values of these compounds are shown in Table 5—2.

### Example 10

In 150 ml of ethanol were added 2.77 g of 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound (35), 1.0 g of potassium hydroxide and 1.9 g of benzyl chloride, and the mixture was refluxed under heating for five hours. After the ethanol was removed from the reaction solution, 100 ml of chloroform was added to the resulting solution, and the solution obtained was washed with a buffer solution having a pH of 5.5 and extracted twice with 20 ml of a 2N aqueous hydrochloric acid solution. The aqueous hydrochloric acid layer was rendered alkaline, extracted twice with 50 ml of chloroform, and the chloroform layer extracted was washed with water and dried with anhydrous magnesium sulfate. After the chloroform was distilled therefrom under reduced pressure, 5 ml of a 10N aqueous hydro-10 chloric acid solution was added to the residue and the mixture was condensed to dryness. The crystalline residue thus obtained was recrystallized from ethanol to give 2.9 g of 1-(5-isoquinolinesulfonyl)-4-benzylpiperazine [i.e., Compound (56)] dihydrochloride in a yield of 66%.

#### Example 11

In 50 ml of chloroform were added 2.77 g of 1-(5-isoquinolinesulfonyl)piperazine, i.e., Compound 35 and 1.54 g of anhydrous potassium carbonate, and to the mixture was added dropwise 1.70 g of benzoyl chloride under cooling with ice, and the mixture was stirred at a temperature of 15°C to 20°C for three hours. The reaction solution was washed with a 1N aqueous sodium hydroxide solution, then with water and dried with anhydrous magnesium sulfate. After the chloroform was distilled therefrom, 25 the residue thus obtained was subjected to a silica gel column chromatography (silica gel: 70 g; solvent: chloroform) to give 2.7 g of 1-(5-isoquinolinesulfonyl)-4-benzoylpiperazine, i.e., Compound (58) in a yield of 71%.

Melting point (the hydrochloride): 217°C

Mass spectrum (m/e): 381 (M+), 318, 276 and 289

NMR spectrum (CDCl<sub>3</sub>,  $\delta$ ): 3.1—3.9 (8H,  $4\times$ CH<sub>2</sub>), 7.2 (5H), 7.5—8.5 (5H) and 9.3 (1H) IR absorption spectrum ( $\nu_{\rm max}^{\rm cap}$ , cm<sup>-1</sup>): 1690, 1370 and 1160.

The same procedures as described above were repeated using the compounds of the formula, -W under the reaction conditions as set forth in Table 6—1, and there were obtained 1-(5-35 isoquinolinesulfonyl)-4-cinnamoylpiperazine, i.e., Compound (60) and 1-(5-isoquinolinesulfonyl)-4furoylpiperazine, i.e., Compound (61). The results and the analytical values of these compounds are shown in Table 6-2.

#### Example 12

In 30 ml of methylene chloride were dissolved 1.75 g of 2,5-dimethylpiperazine and 1.53 g of triethylamine, and to the solution was added dropwise 20 ml of a methylene chloride solution containing 1.73 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the methylene chloride solution, the mixed solution obtained was stirred at a temperature of 5°C to 10°C for three hours, and then the reaction mixture solution was washed with water and dried with anhydrous magnesium sulfate. After the methylene chloride was distilled therefrom, the residue obtained was subjected to an alumina column chromatography (alumina: 50 g; solvent: chloroform) to give 1.38 g of 1-(5-isoquinolinesulfonyl)-2,5-dimethylpiperazine, Compound (40) in a yield of 59%.

Mass spectrum (m/e): 305, 277, 249, 192 and 128 NMR spectrum (CDCI<sub>3</sub>): 0.8—1.3 (6H,  $2\times CH_3$ ), 1.7 (1H, NH), 2.3—4.2 (6H,  $2\times CH_2+2\times CH$ ), 7.6 (1H), 8.0—8.8 (4H) and 9.3 (1H).

Example 13

In 50 ml of chloroform wer dissolved 4.68 g of 1-benzyloxycarbonyl-3-methylpiperazine and 1.01 g of triethylamine, and to the solution was added dropwise 20 ml of a chloroform solution containing 4.55 g of 5-isoquinolinesulfonyl chloride, and the mixed solution was stirred at a temperature of 20°C to 25°C for 20 hours. The reaction solution obtained was washed with a saturated aqueous sodium hydrogencarbonate solution then with a saturated aqueous ammonium chloride solution, dried with anhydrous magnesium sulfate and concentrated to dryness under reduced pressure to 8.1 g of 1-(5-isoquinolinesulfonyl)-4-benzyloxycarbonyl-2-methylpiperazine as a yellowish white oily substance.

To 1.65 g of 1-(5-isoquinolinesulfonyl)-4-benzyloxycarbonyl-2-methylpiperazine as obtained above was added 5 ml of 25% hydrobromic acid-acetic acid, and the mixture was stirred at 20°C for five hours. To the reaction solution was added 30 ml of ethyl ether, and the crystals precipitated were separated by filtration. The crystals thus obtained were dissolved in 20 ml of water and washed with chloroform. Then the pH of the aqueous layer was adjusted to 9 with a 1N aqueous sodium hydroxide solution, extracted with chloroform, and the chloroform layer was washed with water and dried with anhydrous magnesium sulfate. Then the chloroform was distilled therefrom under reduced pressure to give 1.05 g of 1-(5-isoquinolinesulfonyl)-2-methylpiperazine, i.e., Compound (38) in a yield of 93%.

Example 14

In 40 ml of chloroform were dissolved 2.23 g of 2-benzyloxycarbonyl-1-methylethylamine and 1.2 g of triethylamine, and to the solution was added dropwise 20 ml of a chloroform solution containing 2.28 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the chloroform solution, the mixed solution was stirred at a temperature of 20°C to 25°C for two hours. The reaction solution obtained was washed with a saturated aqueous hydrogencarbonate solution, then with water, dried with anhydrous magnesium sulfate and then the chloroform was distilled therefrom under reduced pressure to give 3.55 g of N-(2-benzyloxycarbonylamino-1-methyl-5-isoquinolinesulfonamide in a yield of 89%.

To 2.0 g of N-(2-benzyloxycarbonylamino-1-methylethyl)-5-isoquinolinesulfonamide as obtained above was added 5 ml of 25% hydrobromic acid-acetic acid, and the mixture was stirred at a temperature of 20°C to 25°C for 20 hours. To the reaction solution was added 30 ml of ethyl ether, and the crystals precipitated were separated by filtration. The crystals thus obtained were dissolved in 20 ml of water, washed with chloroform, rendered alkaline with a 1N sodium hydroxide solution and extracted with chloroform. The chloroform layer was washed with water, drled with anhydrous magnesium sulfate and the chloroform was distilled under reduced pressure to give 1.2 g of N-(2-amino-1-methylethyl)-5-isoquinolinesulfonamide, i.e., Compound (6) in a yield of 90%.

## Example 15

In 50 ml of chloroform were dissolved 2.0 g of 2-acetamidopropylamine and 2.6 g of triethylamine, and to the solution was added dropwise 50 ml of a chloroform solution containing 3.28 g of 5-isoquinolinesulfonyl chloride under cooling with ice. Then the mixed solution was stirred at a temperature of 15°C to 25°C for two hours, and the reaction solution was washed with water, dried with anhydrous magnesium sulfate and the chloroform was distilled therefrom under reduced pressure to give 3.67 g of N-(2-acetamidopropyl)-5-isoquinolinesulfonamide in a yield of 83%.

The reaction mixture of 3.0 g of the N-(2-acetamidopropyl)-5-isoquinolinesulfonamide as obtained above and 50 ml of 10% hydrochloric acid was stirred at a temperature of 90°C to 100°C for 36 hours. Then the reaction solution was washed with chloroform, rendered alkaline with 1N sodium hydroxide and extracted with chloroform. The chloroform layer was washed with water, dried with anhydrous magnesium sulfate, and the chloroform was distilled therefrom under reduced pressure. The residue thus obtained was subjected to an alumina column chromatography (alumina: 70 g; solvent: chloroform) to give 1.14 g of N-(2-aminopropyl)-5-isoquinolinesulfonamide, i.e., Compound (9) in a yield of 44%.

Example 16

In 70 ml of methylene chloride were dissolved 3.24 g of 2-(2-N-methyl-N-benzylamino)ethylamine and 2.0 g of triethylamine, and to the solution was added dropwise 50 ml of a methylene chloride solution containing 3.0 g of 5-isoquinolinesulfonyl chloride under cooling with ice. After the dropwise addition of the methylene chloride solution, the mixed solution was stirred at a temperature of 15°C to 25°C for one hour, and then the reaction solution was washed with water and extracted with a 10% aqueous hydrochloric acid solution. The aqueous layer was washed with chloroform, rendered alkaline with a 1N aqueous sodium hydroxide solution, extracted with chloroform, and then the chloroform layer was washed with water, dried with anhydrous magnesium sulfate and 10 the chloroform was distilled therefrom under reduced pressure. The residue thus obtained was subjected to a silica gel column chromatography (silica gel: 100 g; solvent: chloroform) to give 3.84 g of N-[2-(N-methyl-N-benzylamino)ethyl]-5-isoquinolinesulfonamide, i.e. Compound (65) in a yield of 84%.

Example 17
In 100 ml of ethanol was dissolved 2.0 g of N-[2-(N-methyl-N-benzylamino)ethyl]-5-isoquinolinesulfonamide, i.e., Compound (65) as obtained in Example 16, and to the solution was added 0.2 g of 10% palladium-carbon. After a home bred rabbit of a Japanese species weighing about 3 Kg was subjected to bloodletting, resulting in death and then to abdominal incision, the mesenteric artery was taken out, cut into helicoids of 2 mm x 25 mm and suspended in a 20 ml organ bath filled with a Krebs-Henseleit solution into which a mixed gas of 95% by volume of O2 and 5% by volume of CO2 was introduced and one end of the artery was connected with an isometric transducer. When a load of 1.5 g was applied to the artery, the contraction and the relaxation of the artery were recorded as a weight on the transducer (a product of Nippon Koden K.K., Japan, "FD Pickup TB—912T"). The relaxation of the mesenteric artery was observed by adding the isoquinolinesulfonyl derivatives and their pharmaceutically 10 acceptable acid addition salts of this invention to the mesenteric artery at the condition of about one half of the maximum contraction with KCl at KCl concentration of 15-20 mM. When the complete relaxation of the mesenteric artery was designated 100%, the concentration of the isoquinolinesulfonyl derivatives and their pharmaceutically acceptable acid addition salts which brought about a relaxation of 50% is shown in Table 12.

# Effect on Blood Flow Volume of Femoral and Vertebral Arteries of Dog

The effect on the vasodilatation of the femoral and vertebral arteries was measured by anesthetizing a dog of mixed breed weighing 8 to 15 Kg by an intravenous administration of 35 mg/Kg of pentbarbital, providing an acute type probe (a product of Nippon Koden K.K., Japan) with the femoral and vertebral arteries, administering the 5-isoquinolinesulfonyl derivatives and their pharmaceutically acceptable acid addition salts to the femoral vein through a polyethylene tube inserted into the femoral vein side chain and measuring the blood flow volume with an electromagnetic blood flowmeter (a product of Nippon Koden K.K., Japan, "MF-27"). The results are shown in Table 13.
